

Q1 2020: New Zealand Construction and Infrastructure Survey

Activity contracts amid nationwide lockdown

- · Covid-19 outbreak and subsequent lockdowns lead to a contraction in activity
- · Largest firms expect to be buoyed by infrastructure workloads; reductions in headcount expected
- · Costs putting pressure on margins; deflationary risks emerging in South Island

Respondents to the RICS New Zealand Construction and Infrastructure Survey in Q1 of 2020 noted a significant pullack in market conditions. At the national level, the implementation of nationwide lockdowns appears to have had a significant effect on activity. Respondents noted a pullback in each segment of the market. Work on infrastructure projects appear to be slightly more resilient, though a significant contraction in work on airports was noted.

Conditions converge in North and South

Perhaps the most notable outcome in these results was the convergence in conditions between the North and South Islands. Survey participants in the South Island noted that conditions have been more subdued for the last several quarters, though the shock from Covid-19 has weighed on market activity. Contributors in the North Island had consistently been noting an increase in activity. However, the coronavirus pandemic appears to have derailed this momentum as non-infrastructure workloads contracted during the first quarter of 2020. Unsuprisingly, financial constraints are now seen as a greater drag on activity than skills or labour shortages.

Largest firms more optimistic

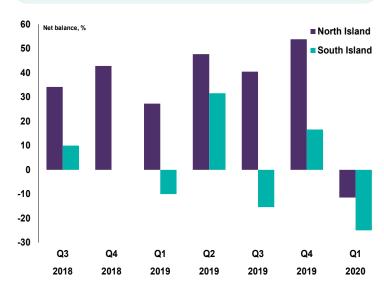

Characteristic of a systemic shock, the inital effects of the pandemic appear to be affecting firms of different sizes equally. Most companies appear to have not yet reduced headcount during Q1, though pressure on margins appears to have deteriorated. There seems to be some differences in the outlook for different sized firms, however. Respondents from all firms except for the largest (those with more than 250 employees) expect both infrastructure and non-infrastructure workloads to decline over the next twelve

months. Those at the largest firms, however, expect infrastructure workloads to increase over the next twelve months. Although this depends much likely on the duration of the lockdown and the government's planned stimulus measures once restrictions have been lifted, at this junction headcounts are largely expected to be cut over the next year.

Growing risk of deflation

Respondents in both the North and South Islands expect construction costs to rise faster than tenders over the next twelve months, which likely contributes to the grim outlook for profit margins. More notably, there appears to be a real risk of deflation in the South Island, as some costs (and tenders) are seen declining.

2

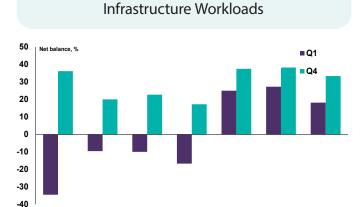

Regional Charts - North Island

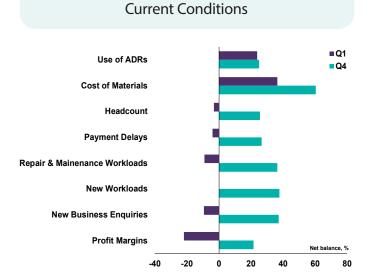

Construction market conditions deteriorated significantly in Q1 of 2020, according to survey participants. The level of work, which had risen across all market segments (including infrastructure) in Q4 of 2019 broadly contracted to begin 2020.

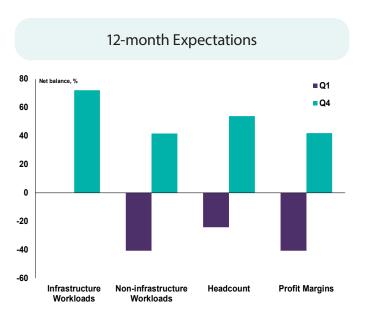

Despite these conditions, respondents noted little change in new demand or new workloads. In some segments of the infrastructure market, namely rail, road and utilities projects, the level of work was said to have increased, albeit at a more modest pace than was reported in Q4.

A majority of contributors noted financial constraints were holding back activity, and significantly more cited a lack of demand as a constraint in Q1 than did in Q4. The outlook for the next year is subdued, with a reduction in headcount expected.

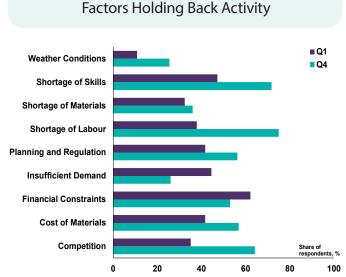

3

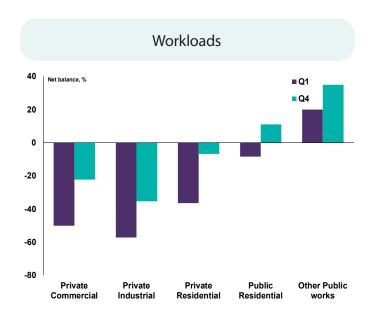

Regional Charts - South Island

Survey respondents in the South Island reported a further deterioration of conditions in Q1 of 2020. Private sector activity was seen to have contracted at a quicker pace than what was reported in Q4. Public works, including infrastructure, appeared to be slightly more resilient.

Financial constraints were the top factor cited as holding back activity by respondents, as profit margins were said to have deteriorated further. Although the pipeline of new workloads was not seen to have changed significantly during the quarter, a lack of demand was also highlighted by a majority.

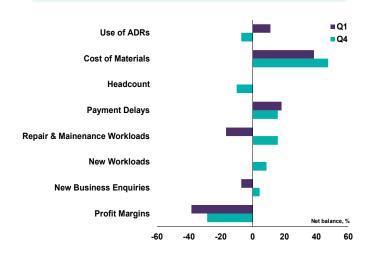

Looking towards the next twelve months, noninfrastructure workloads are expected to decline, as is headcount, while margins are seen coming under significant pressure.

Information

Construction and Infrastructure Survey

RICS' Asia-Pacific and Middle East Construction and Infrastructure Survey is a quarterly guide to the trends in the construction and infrastructure markets. The report is available from the RICS website www.rics.org/economics along with other surveys covering the housing market, residential lettings, commercial property, construction activity and the rural land market.

Methodology

Survey questionnaires were sent out on 11 March 2020 with responses received until 16 April 2020. Respondents were asked to compare conditions over the latest three months with the previous three months as well as their views as to the outlook. A total of 1323 company responses were received globally. Results are collated at a country level with regional results only reported if a minimum of ten responses received. Responses in Canada were collected in conjunction with the Canadian Institute of Quantity Surveyors. Responses in the United States were collected in conjunction with the Association for the Advancement of Cost Engineering.

Net balance = Proportion of respondents reporting a rise in a variable (e.g. occupier demand) minus those reporting a fall (if 30% reported a rise and 5% reported a fall, the net balance will be 25%). Net balance data can range from -100 to +100.

A positive net balance reading indicates an overall increase while a negative reading indicates an overall decline.
